About This Guide

This guide is a complement to Quick Installation Guide. The Quick Installation Guide provides instructions for quick internet setup, while this guide contains details of each function and demonstrates how to configure them.

When using this guide, please notice that features of the router may vary slightly depending on the model and software version you have, and on your location, language, and internet service provider. All screenshots, images, parameters and descriptions documented in this guide are used for demonstration only.

Conventions

In this guide the following conventions are used:

Convention	Description
Underlined	Underlined words or phrases are hyperlinks. You can click to redirect to a website or a specific section.
Teal	The content and text that needs to be emphasized on the web page is the theme color $\#1D428A$, including menus, items, buttons, etc.
>	The menu structures to show the path to load the corresponding page. For example, More > Network > Mode Selection means the Mode Selection function page is under the Network menu that is located in the More tab.
Note:	Do not ignore this type of comment, it is to remind you to better use the device, to avoid the operation of the error that will cause the function to be invalid.
Tips:	Indicates important information that helps you make better use of your device.

More Info

The latest software, management app and utility are available from the Download Center at https://docs.wavlink.xyz/Firmware/.

A guick installation guide can be found in this guide.

Specifications can be found on the product page at https://docs.wavlink.xyz/.

If you encounter any issues, please don't hesitate to email contact@wavlink.com/techsupport@wavlink.com/postsales@wavlink.com to provide feedbacks or contact online customer service, thank you!

Speed/Coverage Disclaimer

*Maximum wireless signal rates are the physical rates derived from IEEE Standard 802.11 specifications. Actual wireless data throughput and wireless coverage are not guaranteed and will vary as a result of 1) environmental factors, including building materials, physical objects, and obstacles, 2) network conditions, including local interference, volume and density of traffic, product location, network complexity, and network overhead, and 3) client limitations, including rated performance, location, connection, quality, and client condition.

Information in this document is subject to change without notice. The manufacturer does not make any representations or warranties (implied or otherwise) regarding the accuracy and completeness of this document and shall in no event be liable for any loss of profit or any commercial damage, including but not limited to special, incidental, consequential, or other damage.

Safety Instructions

Always read the safety instructions carefully.	Always	read	the	safety	instruct	ions	careful	ly.
--	--------	------	-----	--------	----------	------	---------	-----

Keep this Quick Start Guide for future reference.

Keep this equipment away from humidity.
f any of the following situation arises, get the equipment checked by a service technician:
The equipment has been exposed to moisture.
The equipment has been dropped and damaged.
The equipment has an obvious sign of breakage.
The equipment has not been working well or you cannot get it work according to Quick start Guide.

Copyright Statement

No part of this publication may be reproduced in any form by any means without the prior written permission.

Other trademarks or brand names mentioned herein are trademarks or registered trademarks of their respective companies.

WEEE Directive & Product Disposal

At the end of its serviceable life, this product should not be treated as household or general waste. It should be handed over to the applicable collection point for the recycling of electrical and electronic eauipment, or returned to the supplier for disposal.

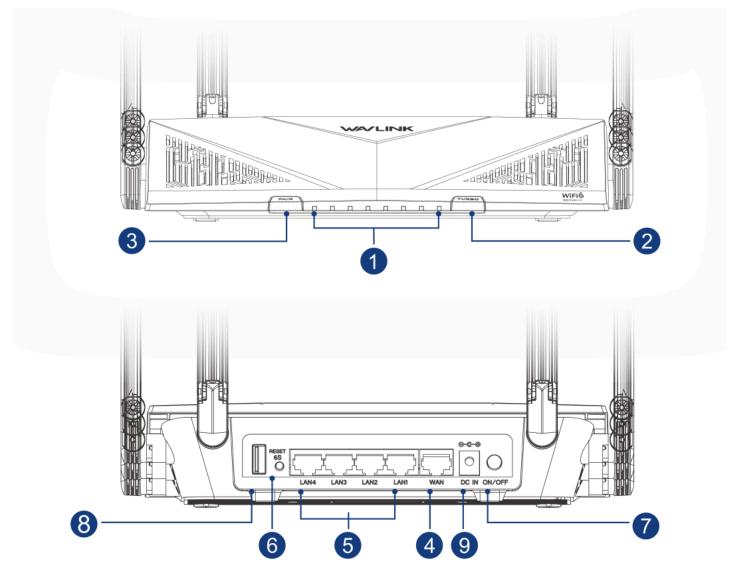

Chapter 1 Overview

This chapter contains the following sections:

- Overview
- LED Indicator
- Basic Info

Overview

- ① Status LED
- ② Turbo Button
- 3 PAIR Button
- 4 1 x 2.5G WAN Port

- 5 4 x Gigabit LAN Ports
- 6 Reset Button
- Power ON/Off Button
- ® USB 3.0 Port
- 9 Power IN Port

PAIR Button: Press and hold for **2** seconds to pair with the existing Mesh WiFi system.

Reset Button: Press and hold for at least 6 seconds to reset the router.

Turbo Button: Press this button to clean the router's cache.

LED Indicator

LED	Status and Description
WiFi	Solid on: WiFi enabled Off: WiFi disabled
WAN	Blinking: The WAN port is transmitting or receiving data Off: The WAN port is not connected properly
LAN1/2 LAN3/4	Blinking: The LAN port is transmitting or receiving data Off: The LAN port is not connected properly
Status LED	Solid on: The device is on and has network connection Slow flashing: The device is pairing Fast flashing: Turbo button is working Fast flashing: The device has no network connection Off: The device is not turned on
Power	Solid on: Powered on Off: Powered off

Chapter 2 Hardware Connection

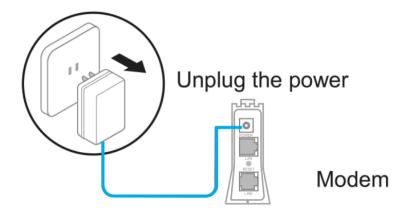

• Router Setup Guide

Router Setup Guide

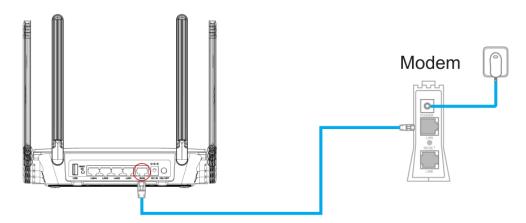

1.Prepare the Modem

1.1 Unplug the power adapter from your DSL modem. If the modem has backup battery, please remove it.

Note: If using a DSL Internet connection, obtain the login credentials (username/password) from your Internet Service Provider (ISP) to properly configure your wireless router.

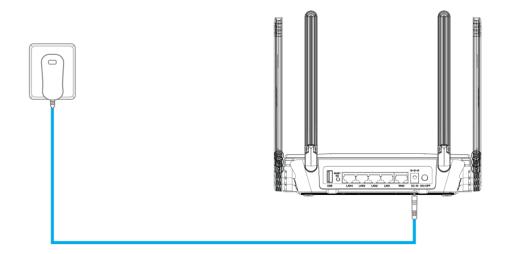

- 1.2 Use the provided Ethernet cable to connect the modem to the WAN port of the router.
- 1.3 Plug the modem into a power outlet and turn it on.

1.4 Check the indicator lights on the modem to confirm a stable Internet connection.

2.Install Your Router

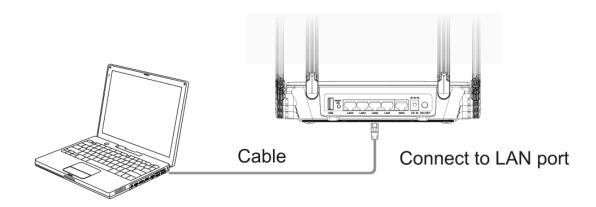

2.1 Insert the power adapter into the router's DC IN port and press the power switch (if applicable, some models lack a physical switch).

2.2 Wait for about 2-3 minutes, then the router is ready.

3. Configure the Router via Web Browser

3.1 Wired Connection: Use another Ethernet cable to connect your computer to one of the LAN ports on the router.

3.2 Wireless Connection: On your laptop or smartphone, connect to the default SSID printed on the router: **WAVLINK-Mesh_XXXX**

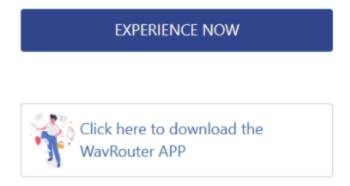

For Windows users

For Mac users

3.3 Open a web browser (via wired or wireless connection) and enter http://wavlogin.link in the address bar. You will automatically enter the WAVLINK router initial setup page. If not, manually enter http://192.168.20.1 in the browser's address bar and follow the instructions.

Welcome to WAVLINK

Chapter 3 Initial Setup

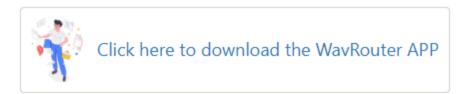

• Setup Guide

Setup Guide

1.Input 192.168.20.1 or http://wavlogin.link in the address bar of the browser. Click on **Experience Now**.

Welcome to WAVLINK

Experience Now

2. Select your network connection way from the **WAN Type** list.

1) DHCP(Dynamic Host Configuration Protocol)

- It assigns network information including IP, Subnet Mask, default Gateway and others for the computer, designed for small network environments such as a home or a small office, managing and assigning IP without manual configuration.
- If the ISP(Internet Service Provider) has provided Auto Assign Feature for you, select DHCP from the **WAN Type** list.

2) PPPoE(Point-to-Point Protocol over Ethernet)

If functions as a secure connection constructor, including verifying user identity, assigning IP, and others. It is designed for broadband access methods such as ADSL, fiber optics and others to provide a secure network connection.

If the ISP has provided a **Username** and **Password** for you, enter them after selecting PPPoE from **WAN Type** list.

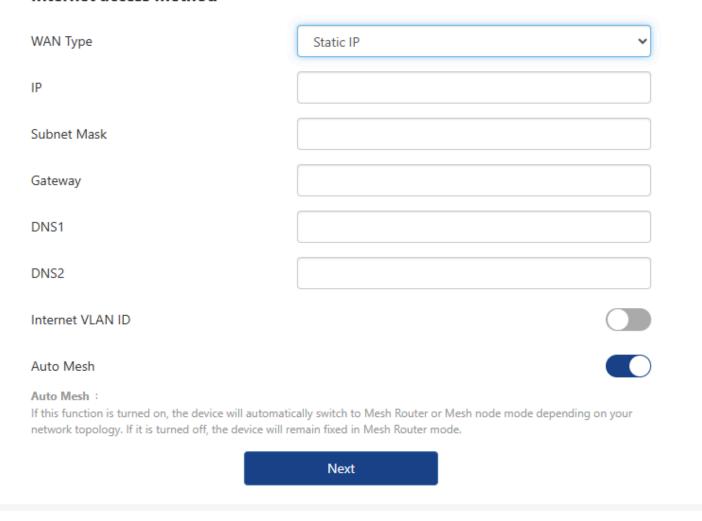

Username Password Get PPPoE Username and Password From Old router Internet VLAN ID Auto Mesh Auto Mesh: If this function is turned on, the device will automatically switch to Mesh Router or Mesh node mode depending on your network topology. If it is turned off, the device will remain fixed in Mesh Router mode.

3) Static IP

It assigns fixed IP address for the computer automatically. It is designed for network connections, servers, remote access, etc., which require long-term stability to ensure the stability of network connections.

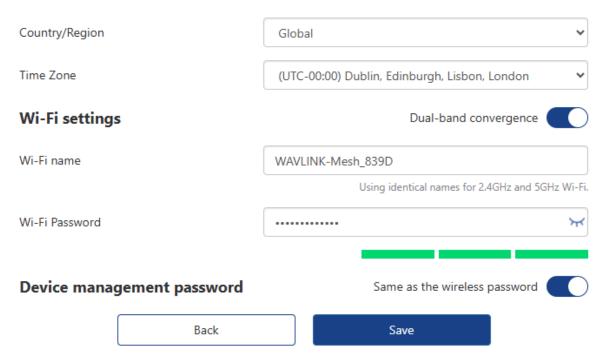

If the ISP has provided a specified IP parameters including IP address, Subnet Mask, Gateway, DNS1 and DNS2, select Static IP from the list and enter the information provided by the ISP.

Internet access method

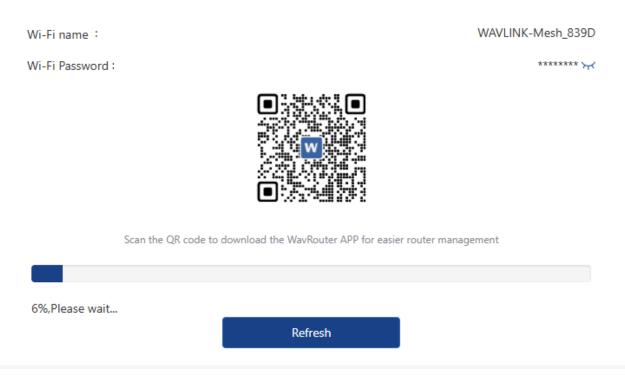

3.Select your **Country/Region** and **Time Zone**, then set your **Wi-Fi Name** and **Password**. Click **Save** to continue.

Country code/Time zone

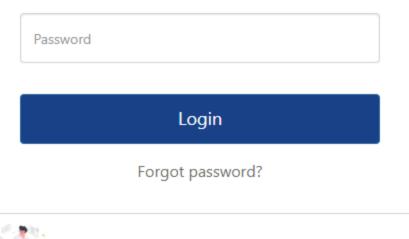

4. Wait for the setup to complete. Click **Refresh**.

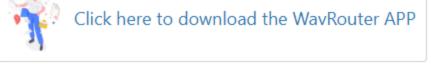

Setting successful, please wait for the setup to complete. Use the new Wi-Fi password to connect to the Wi-Fi.

5.Enter the password you have set, and click **Login**.

Welcome to WAVLINK

To configure the router's working mode, refer to Mode Selection section within Chapter 4.

Chapter 4 Network Management

This chapter contains the following sections:

- Network Setting
- LAN Setting
- Setting Static IP Binding
- Setting IPv6
- IPTV Setting
- DNS Setting
- Mode Selection
- SQM QoS
- URL Filter

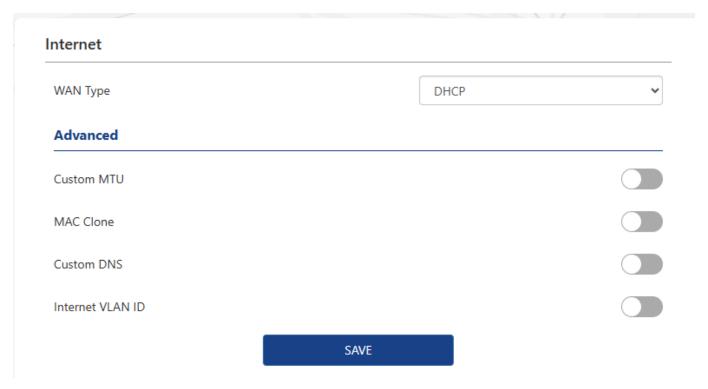

Network Setting

The way of network access can be changed as your requirement through configurating the network setting.

- 1 . Access **Network** setting or **More>Network>Internet**.
- 2 . Select your network connection way from the **WAN Type** list.

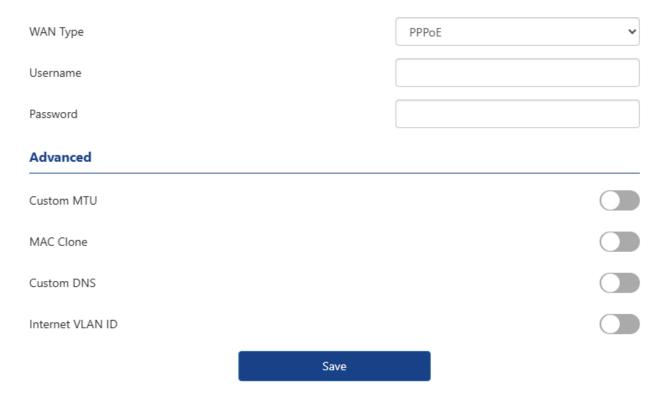

1) DHCP(Dynamic Host Configuration Protocol)

- It assigns network information including IP, Subnet Mask, default Gateway and others for the computer, designed for small network environments such as a home or a small office, managing and assigning IP without manual configuration.
- If the ISP(Internet Service Provider) has provided Auto Assign Feature for you, select DHCP from the WAN Type list.

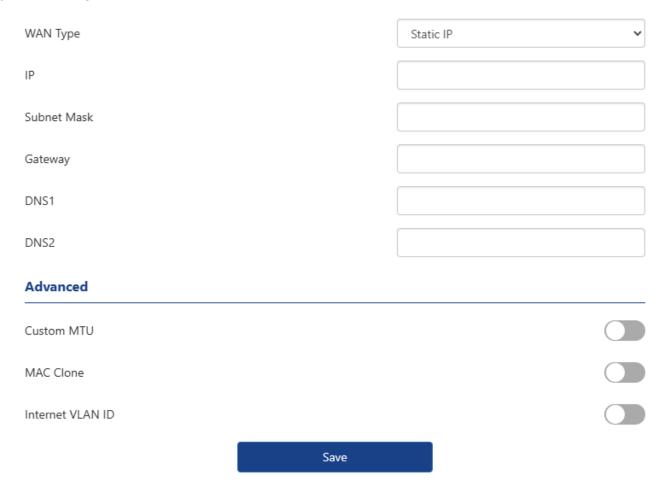

2) PPPoE(Point-to-Point Protocol over Ethernet)

- It functions as a secure connection constructor, including verifying user identity, assigning IP, and others. It is designed for broadband access methods such as ADSL, fiber optics and others to provide a secure network connection.
- If the ISP has provided a **Username** and **Password** for you, enter them after selecting PPPoE from **WAN Type** list.

3) Static IP

- It assigns fixed IP address for the computer automatically. It is designed for network connections, servers, remote access, etc., which require long-term stability to ensure the stability of network connections.
- If the ISP has provided a specificed IP parameters including IP address, Subnet Mask, Gateway, DNS1 and DNS2, select Static IP from the list and enter the information provided by the ISP.

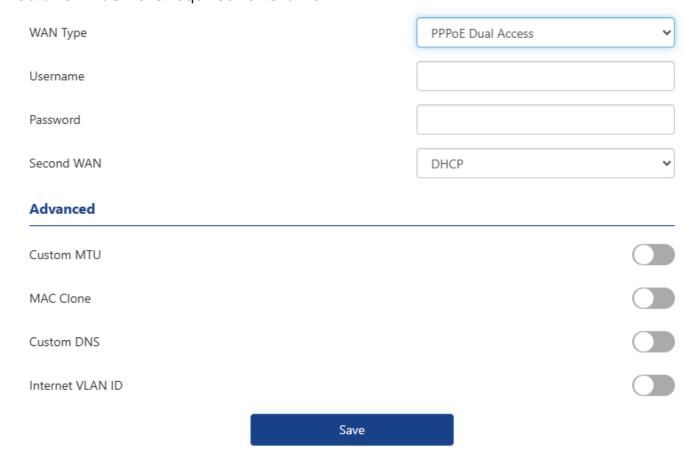

4) USB Tethering

• It works to share network connection after connecting the USB devices to the router.

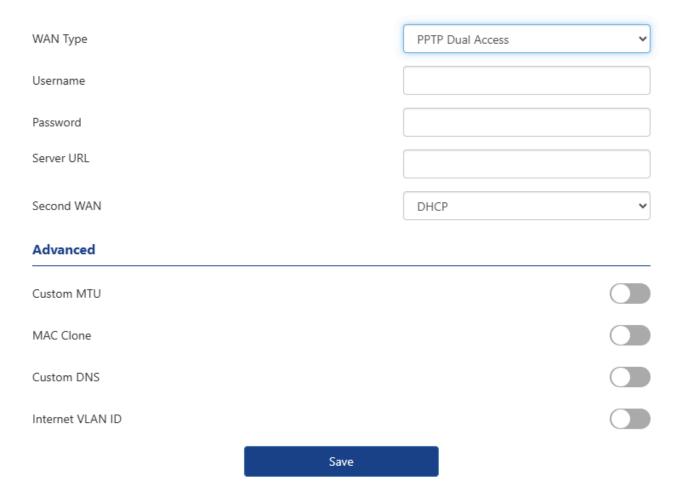

5) PPPoE Dual Access

 Using dual PPPoE broadband lines, PPPoE Dual Access achieves balanced distribution via the technology of Load Balancing. Designed for improving the network bandwidth and stability, so it is for the occassion that requires large data transmission. Enter the account and password provided by the ISP in Username and Password.
 Then select DHCP or Static IP from Second WAN list, one note is that IP and
 Subnet Mask are required for Static IP.

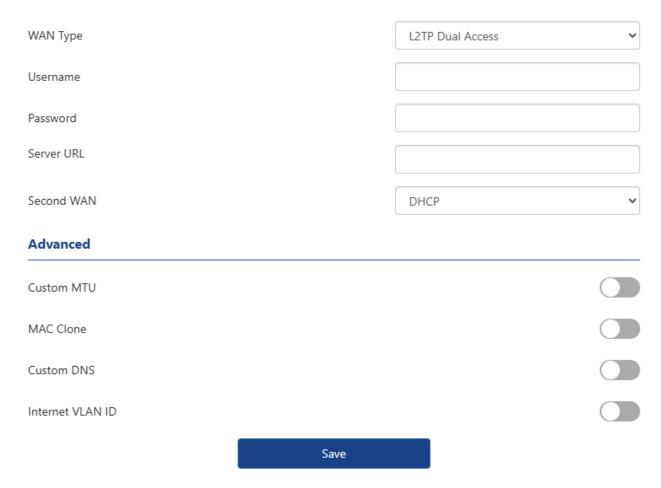

6) PPTP Dual Access

- PPTP Dual Access refers to the dual-network accessing method of using two PPTP VPNs. With it, users can configure two PPTP VPN to simultaneously access the Internet, enhancing the reliability of bandwidth and network.
- Enter **Username**, **Password**, **Server URL**, then select **DHCP** or **Static IP**, one note is that **IP** and **Subnet Mask** are required for selecting **Static IP**.

7) L2TP Dual Access

- L2TP Dual Access uses two L2TP VPN connections to access the Internet. It allows users to use two VPNs to access the Internet, enhancing the reliability of bandwidth and network.
- Enter Username, Password and Server URL, then select DHCP or Static IP, one
 note is that IP and Subnet Mask are required for Static IP.

3 . In **Advanced**, open and configure **Custom MTU**, **MAC Clone**, **Custom DNS**, **Internet VLAN ID** and others as your requirements.

Custom MTU(MaximumTransmission Unit)

 The Ethernet MTU(MaximumTransmission Unit) is the largest size of a data packet that can be transmitted over the network. If your ISP requires you to adjust the MTU size, enable this option. Otherwise, we recommend you to keep it disabled for optimal network performance.

MAC Clone

• The MAC clone allows you to copy the MAC address from the computer to the WAN interface of the router. When an ISP restricts internet access to a single

MAC address, by cloning the MAC address of the device, the router will appear as the original device, ensuring an uninterrupted internet connection.

Custom DNS

 The custom DNS allows you to configure optimal DNS server for the network manually, instead of using the default DNS provided by the ISP.

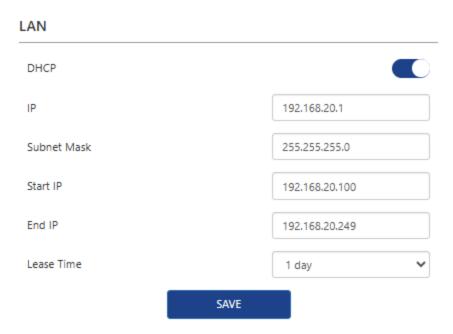

Internet VLAN ID

- The Internet VLAN ID is setted to recognizing the feature of Internet data. For specific settings, please consult your network operator's customer service or technical support staff.
- 4 . Click **Save** to finish configuration.

LAN Setting

DHCP server automatically assigns IP for the devices in the LAN. If it is required, you can change its setting.

- 1. Click More>Network>LAN.
- Click to enable **DHCP**.

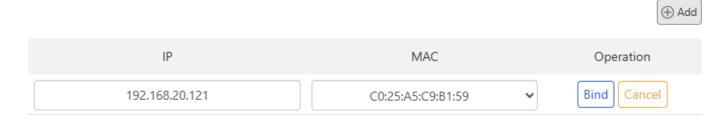

- **IP Address**: The IP address from which the router connects to the LAN. This can be used to log in to the router's network management page.
- Subnet Mask: The subnet mask that the router connects to the LAN.
- **Set IP Address Pool**: When DHCP is enabled, the router automatically assigns IP addresses to devices in the LAN from the address pool. If you need to change the address pool range, modify the Start Address and End Address.

- Lease Time: This is the lease time of the IP address that the device obtains when
 accessing the router. If you need to modify it, please select it again in the Lease
 Time drop-down list.
- 3 . Click **Save** to finish the configuration.

Setting Static IP Binding

It allows you to link the specific IP to the MAC address of customer devices. Using it, you can assign a fixed IP for the specific device so that the device can automatically obtain the same IP everytime it connects to the network.

- 1. Click More>Network>Static IP.
- 2 . Click **Add** in the top right corner to add a binding rule.

Method Of Obtaining

3. Input the IP and MAC, then click Bind.

Setting IPv6

The IPv6 is the next generation Internet protocol, has more space for address, more advanced functions and enhanced security. It aims to solve more issues on interconnectio devices and provide better network performance and security.

IPv4+IPv6 PPPoE

Method Of Obtaining Static IPv6 IPv6 IPv6 Gateway Preferred DNS Alternative DNS

- 3.1 Select corresponding **Method Of Obtaining** from the list, then input corresponding information:
 - DHCPv6: The router automatically obtains the parameters such as IPv6 address. No manual requirements.
 - IPv4+IPv6 PPPoE: When IPv4 Internet access is also PPPoE, you can select IPv4+IPv6 PPPoE. After enabled, IPv6 will use the IPv4 account and password to dial the number, and you do not need to manually enter the IPv6 account and password. Please note that this requires operator's support.
 - Static IPv6: Manually input IPv6(address), IPv6 Gateway, Preferred DNS and Alternative DNS.
- 4 . IPv6 LAN Settings.

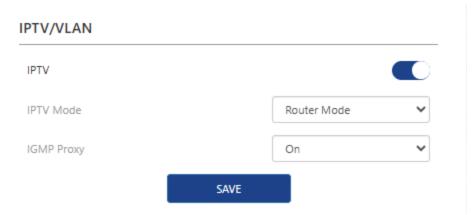

IPv6 Address Assignment Automatic Allocation IPv6 Prefix Automatic Allocation SLAAC IPv6 fd00:7c28:acc8::/48

- Selecting appropriate address assignment method from the IPv6 Address
 Assignment list:
 - Automatic Allocation: It will automatically assign IPv6 addresses to devices on the LAN network.
 - SLAAC: In the SLAAC, The terminals on the LAN will automatically create IPv6
 addresses according to the router. 5. Click Save to finish the configuration.

IPTV Setting

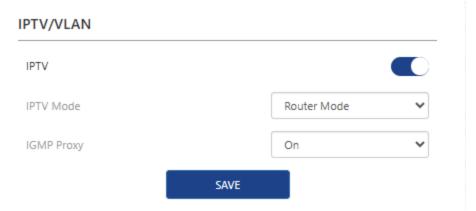

Setting IPTV allows you to enjoy multimedia service while using the network. You should consult IPTV's service provider about **VLAN ID** and how to select **IPTV Mode**. Then you can select the corresponding VLAN Port, and connect IPTV's cable to the corresponding LAN port on the router.

Configuring IPTV

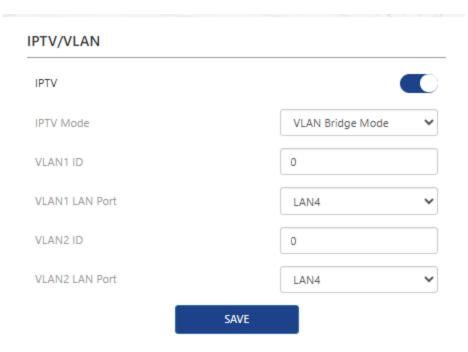

- 1. Enter More>Network>IPTV/VLAN.
- 2. Click once to enable **IPTV**.
- 3 . Select appropriate working mode from the **IPTV Mode** list.

3.1 Router Mode

Enable **IGMP Proxy** if you use IPTV service on multiple devices at the same time.

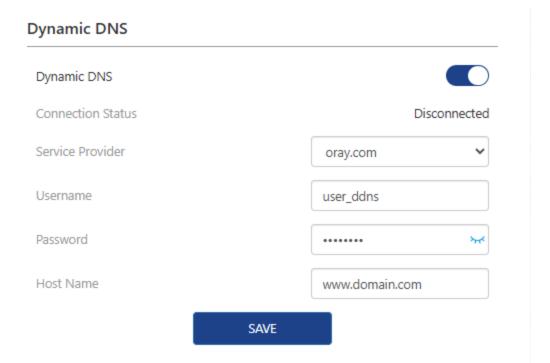

3.2 VLAN Bridge Mode: Enter VLAN ID and select VLAN Port.

- 4 . Click **SAVE** to finish the configuration.
 - VLAN1 ID and VLAN1 LAN Port: The VLAN1 ID indicates the VLAN1, and the VLAN1 LAN Port indicates the LAN port associated with VLAN1.
 - VLAN2 ID and VLAN2 LAN Port: The VLAN2 ID indicates the VLAN2, and the VLAN2 LAN Port indicates the LAN port associated with VLAN2.

Setting Dynamic DNS

Dynamic DNS(DDNS, Dynamic Domain Name System) is a function of mapping dynamic IP addresses to fixed domain names. After enabling it, the router bind dynamic WAN IP with the fixed domain so that you can connect to the router using the domain remotely. In order to use this service, you need to register for the DDNS service with your service provider.

- 1. Enter More>Network>Dynamic DNS.
- Click once to enable **Dynamic DNS**.
- 3 . Select **oray.com** or **NO-IP** from the **Service Provider** list.
- 4 . Input corresponding **Username**, **Password** and **Host Name** from your DNS registration information.
- 5 . Click **SAVE** to finish configuration.

Note: Different dynamic DNS service provider may provide various parameters, and the name or indication may vary. Therefore, you should look up the corresponding explanation so that the correct parameters are inputed.

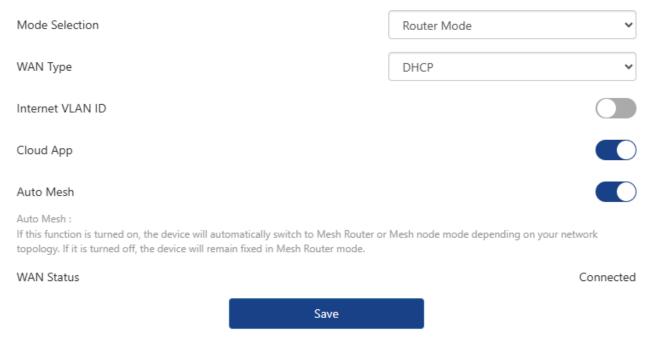

Mode Selection

Configure router's working mode according to your actual requirement.

- 1. Enter More>Network>Mode Selection.
- 2 . Select appropriate working mode from the **Mode Selection** list: **Router Mode**, **LAN Bridge(AP Mode)** or **Repeater Mode**.

Router Mode

 In routing mode, the router converts Wi-Fi signals to wireless Internet access for devices by connecting to the network operator's wired network, and provides wired Internet access for devices through a wired port.

- WAN Type: DHCP, PPPoE or Static IP, inputting the corresponding parameters is required for PPPoE or Static IP.
- Internet VLAN ID: After enabling it, input ID Number. You should consult the ISP about the detailed configurations.
- Cloud App: It allows you to control devices remotely from the cloud using the APP.
- Auto Mesh: If it is enabled, the device will automatically switch to Mesh Router Mode or Mesh Extender Mode depending on the network topology; If it is diabled, the device will keep Mesh Router Mode.

LAN Bridge(AP Mode)

 In the AP mode of extending the existing network, you should confirm your device's WAN port has connected to the Internet using the Ethernet cable. One note is that some functions are not available in this mode.

 Smart DHCP Service: If it is enabled, the router will configure IP service without connecting to the upper router. Please disable it if it is not required.

Repeater Mode

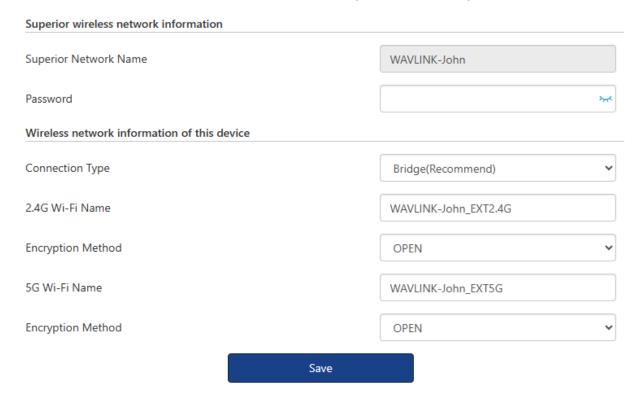

• In the repeater mode, to extend the Wi-Fi coverage, this router works as a wireless repeater of the upper router. One note is that some functions are not available in this mode.

- 2) Select the wireless signal to be relayed, click **NEXT**.
- 3) If the network to be added is not found, click **Rescan** to rediscover the network.Or select **Manual Input** to set it up.

 4) Enter the password of the superior wireless network and the wireless network information of this device. Click **Save** to complete the setup.

SQM QoS

SQM QoS uses smart queue management to classify, schedule, and prioritize network traffic, effectively controlling network congestion, ensuring bandwidth for critical applications, reducing latency, suppressing jitter, and minimizing packet loss, thereby enhancing network service quality.

- 1. Navigate to **More** > **Network** > **SQM QoS**.
- 2. Click to enable **SQM QoS**.
- 3. Set the maximum Upload Bandwidth and the maximum Download Bandwidth.
- 4. Click **SAVE** to complete the configuration.

URL Filter

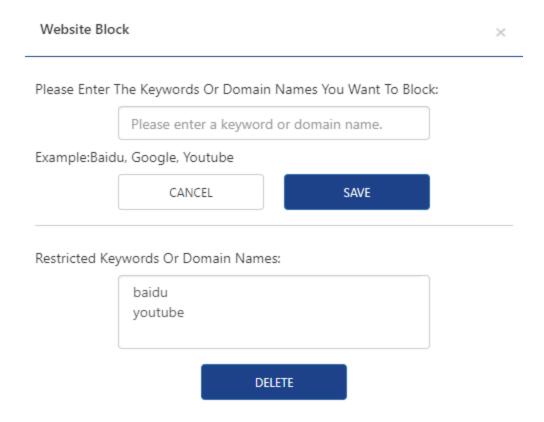

You can block any device connected to this router from accessing specific websites by entering keywords or the full domain name.

1. Click + icon in **URL Filter**.

URL Filter

Device Information	MAC	URL Filter
DESKTOP-GO5J024	80:3F:5D:06:D1:DB	+

2. After entering the keywords or the full domain name, click **SAVE** to take effect.

Chapter 5 Managing Wireless Network

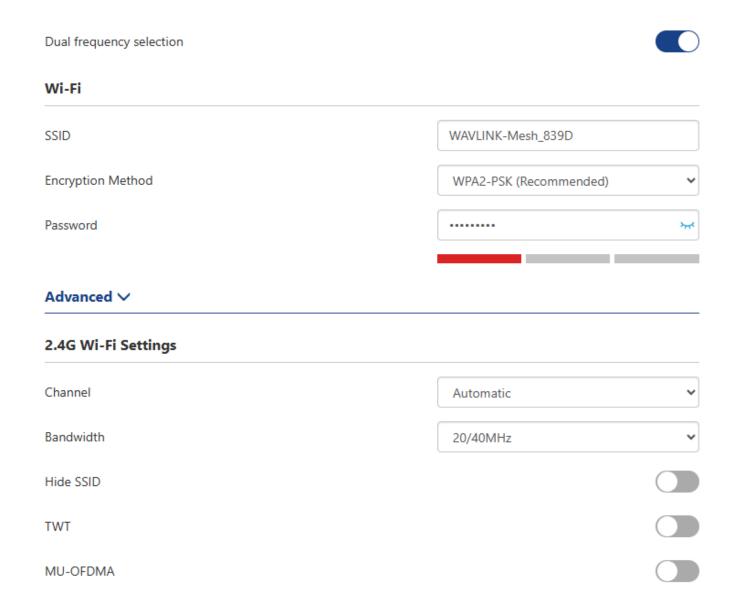

This chapter contains the following sections:

- Wireless
- Guest Wi-Fi
- Parental WiFi

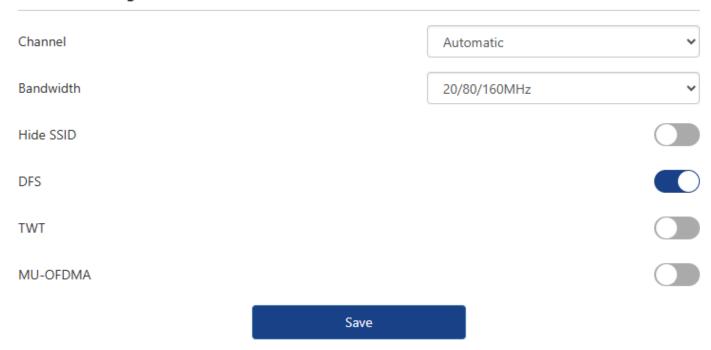

Wireless

Configure the SSID, encryption method, password, and other wireless parameters for both the 2.4G and 5G networks.

1. Navigate to Wireless or go to More > Wireless > Wireless.

5G Wi-Fi Settings

Configuring Wireless Network

1) Dual Frequency Selection

Enabling Dual Frequency Selection combines the 2.4GHz and 5GHz Wi-Fi bands into a single network to provide a better overall network experience. Disabling this feature allows for separate configuration of the 2.4G and 5G networks.

- 1. Navigate to **Wireless** or go to **More** > **Wireless** > **Wireless**.
- 2. Click to enable/disable **Dual Frequency Selection**.
- 2) Setting Wi-Fi SSID and Password
 - 1. Navigate to **Wireless** or go to **More** > **Wireless** > **Wireless**.
 - 2. Set a new wireless network name in the SSID.
 - In the Encryption Method, select an encryption method from the dropdown list.(It
 is recommended to choose WPA3-SAE or WPA2-PSK)
 - 4. Set a new password for your wireless network in the **Password**.

Note: After setting up the new network, you will need to reconnect to the WiFi network using the new password.

Advanced Settings

- 1) Setting Channel and Bandwidth
 - Navigate to Wireless > Advanced or go to More > Wireless > Wireless > Advanced.
 - 2. From the **Channel** dropdown list, select the operating channel for your wireless network. (If you are unsure about which channel to choose, it is recommended to select **Automatic**, so the device can automatically select the optimal channel based on the surrounding environment for your better network experience.)
 - 3. From the **Bandwidth** dropdown list, select the bandwidth for the router's wireless data transmission.
- 2) Setting Hide SSID
 - Navigate to Wireless > Advanced or go to More > Wireless > Wireless > Advanced.
 - 2. Click to enable **Hide SSID**. After enabling this, the wireless signal for the corresponding network will be hidden.
- 3) Setting DFS

After enabling this, the device will automatically avoid channels that are restricted in your region.

- Navigate to Wireless > Advanced or go to More > Wireless > Wireless > Advanced.
- 2. Click to enable **DFS**.

4) Setting TWT

After enabling this feature, the router will automatically optimize resource scheduling between devices, negotiate target wake time to reduce contention, increase device sleep time, and ultimately extend the lifespan of the router.

- Navigate to Wireless > Advanced or go to More > Wireless > Wireless > Advanced.
- 2. Click to enable **TWT**.

Note: This feature requires terminal devices that support Wi-Fi 6. If the terminal device is inactive for a long time, it may disconnect from the router.

5) Setting MU-OFDMA

After enabling this feature, the router will multiplex multiple users to improve transmission efficiency and reduce network latency in multi-user internet environments.

- Navigate to Wireless > Advanced or go to More > Wireless > Wireless > Advanced.
- 2. Click to enable MU-OFDMA.

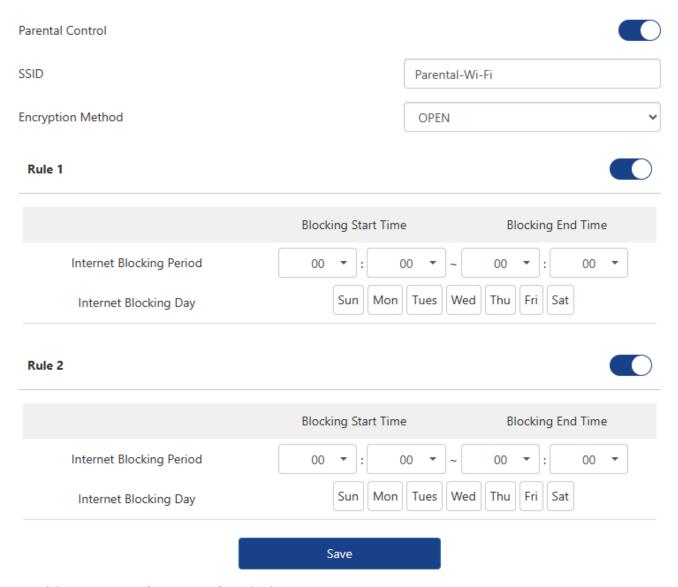

Guest Wi-Fi

This feature allows you to provide Wi-Fi to guests without exposing your main network. When you have visitors at your home, apartment, or workplace, you can create a guest Wi-Fi for them. Additionally, you can customize guest Wi-Fi settings to ensure security and privacy.

- 1. Navigate to More > Wireless > Guest Wi-Fi.
- Click to enable Guest Wi-Fi.
- 3. Set the **SSID**.
- 4. In the **Guest Wi-Fi Mode**, set the encryption method: Encryption Mode, No Encryption Mode, and WPA/WPA2. If you select WPA/WPA2, you will need to set the RADIUS server IP, RADIUS port, and RADIUS password.
- 5. Set the **Device Isolation**. Once on, this feature will isolate devices connected to the same LAN from each other, enhancing network security and privacy protection.
- 6. Click **Save** to complete the settings.

Parental WiFi

- 1. Enable Parental Control switch.
- 2. Set **SSID(WiFi name)** and **password**, then choose Encryption Method. **WPA2-PSK** is recommended.
- 3. Enable Rule 1 and Rule 2 switch.
- 4. Select Internet Blocking Period and Internet Blocking Day.
- 5. Click on **Save**.

Chapter 6 Mesh

This chapter contains the following section:

Mesh Configuration

Mesh Configuration

If a single router cannot provide adequate wireless coverage for large homes, you can purchase multiple WAVLINK routers that support Mesh networking to achieve full Wi-Fi coverage throughout your home.

Adding New Mesh Device

Before setting up the Mesh network, ensure that:

The main router is connected to the internet and the setup wizard is completed, with the indicator light showing solid blue.

- 1. Navigate to More > Everything Mesh > Mesh Devices.
- 2. Click on **Add**. Follow the on-screen instructions to prepare your mesh device, then click **NEXT**.

Advanced >

Add New Mesh Device

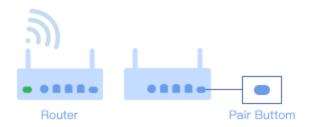

- Please confirm that the main router has successfully connected to the Internet.
- Place the new mesh device you want to add near the main router. If you have used the mesh device, please reset it.

NEXT

3. Follow the on-screen instructions to power on the mesh device and press the pair button when the mesh device starts operating. Click **"Start scanning"**. The main router will automatically scan the mesh device that is attempting to pair.

Add Mesh Node Route

- Power on the Mesh node, and after it has started up, press the pair button.
- Click "Start Scan", and the main router will automatically scan for the Mesh node whose the pair button has been pressed.

4. Once the scan is completed, select the mesh device you want to add.

Advanced Settings

Advanced V		
Roaming		
Roaming Threshold	-68	dBm
Topology Optimization		OPTIMIZATION
Threshold Of Topology Optimization	-69	dBm
SAVE		

1) Roaming (Wireless Roaming Technology)

Enabling Roaming allows devices to seamlessly switch between two Mesh routers. As you move away from one router and get closer to another, the device will automatically disconnect from the current router and connect to the nearer one to provide a smoother network experience.

- 1. Navigate to More > Everything Mesh > Mesh Devices > Advanced.
- 2. Click to enable **Roaming**.
- 3. Set the **Roaming Threshold** to an appropriate parameter.

Note: The wireless roaming trigger threshold should only be set by experienced professionals. If you lack professional experience in setting this, it is recommended to keep the default settings to avoid negatively impacting the network user experience.

2) Topology Optimization

When you have three or more paired devices and all devices have completed pairing, you can enable the topology optimization feature. This function can automatically adjust the optimal path based on the signal strength between devices to ensure that all subrouters and corresponding upper-level devices have the best signal connection status, achieving optimal network coverage.

- 1. Navigate to More > Everything Mesh > Mesh Devices > Advanced.
- 2. Click the **OPTIMIZATION** button after **Topology Optimization**.

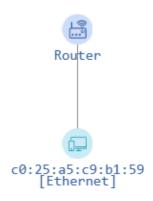

3. Ensure the **Threshold Of Topology Optimization** is set to an appropriate parameter.

Note: You can adjust the signal threshold that triggers topology optimization to achieve the best mesh network coverage. If you do not have professional setup experience, it is recommended to use the default settings.

Topology Map

In this interface, you can see the network topology map, which shows the device access relationships and network connection status. It will also display the MAC address of each connected device, making it easier to see which terminals the devices are connected to.

1. Navigate to More > Everything Mesh > Topology Map.

Chapter 7 Net Guardian

This chapter contains the following sections:

- Secure DNS
- AdGuard Home

Secure DNS

This feature encrypts your DNS traffic to enhance security and privacy, preventing DNS leaks and DNS hijacking.

- 1. DNS Navigate to More > Net Guardian > Custom DNS Server
- 2. Click to enable **Custom DNS Server**.
- 3. Set the **DNS Protocol** and **Server Provider**.
- 4. Click **Save** to complete the configuration.

AdGuard Home

AdGuard Home acts as a global DNS blocker to filter harmful content from the network, such as ads, malwares, trackers, and more.

AdGuard Home also offers advanced functions such as parental control, statistics, custom rule, and more so you can better manage network traffic and protect privacy. By running AdGuard Home on your router, you can have one-stop ad blocking and privacy protection for your entire network without installing separate software or browser plugins on each device.

Initial Settings

- 1. Access More Net Guardian > AdGuard Home.
- 2 . Open AdGuard Home.

- 3 . Click **the URL** behind Manage Page or enter http://192.168.20.1:3000 manually on the browser. Access the AdGuard Home manage page and enter the installation guard page.
 - (i) NOTE

If your router IP is not 192.168.20.1, please change 192.168.20.1 to your router IP.

1) Enter the AdGuard Home manage page, and click **Get Started**.

2) Select the **Listen interface** and bind **Port** on the Admin Web Interface.

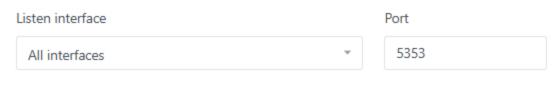

Admin Web Interface

Your AdGuard Home admin web interface will be available on the following addresses:

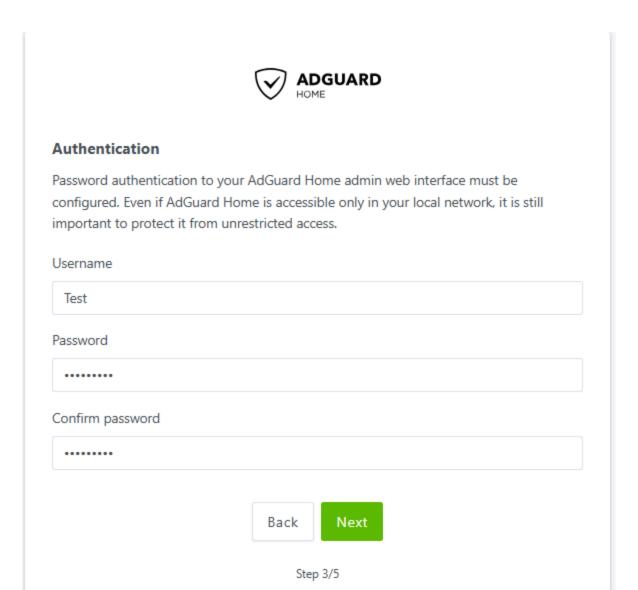

- http://127.0.0.1:8080
- http://172.16.2.111:8080
- http://192.168.20.1:8080
- http://197.131.179.1:8080
- http://[::1]:8080
- http://[fd00:7c28:acc8::1]:8080
- 3) Select the **Listen interface** and bind **Port** on the DNS server.

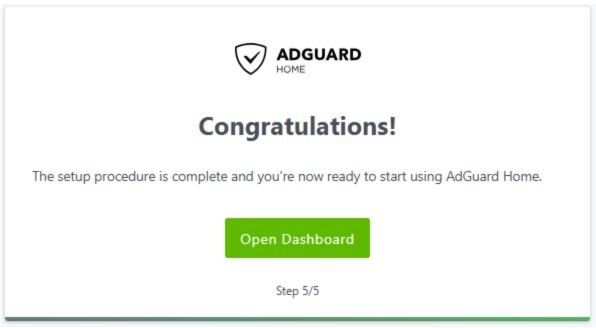

You will need to configure your devices or router to use the DNS server on the following addresses:

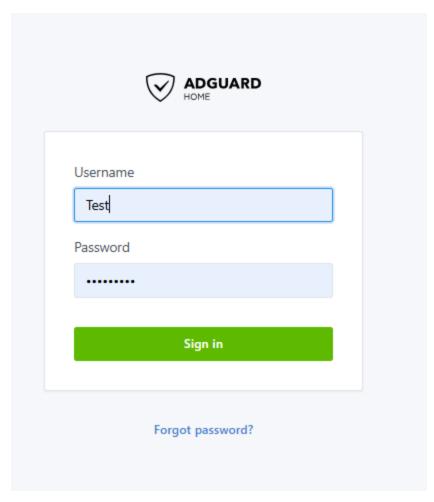

- 127.0.0.1:5353
- 172.16.2.111:5353
- 192.168.20.1:5353
- 197.131.179.1:5353
- [::1]:5353
- [fd00:7c28:acc8::1]:5353
- 4) Set the username and password for AdGuard Home login. Click Next.

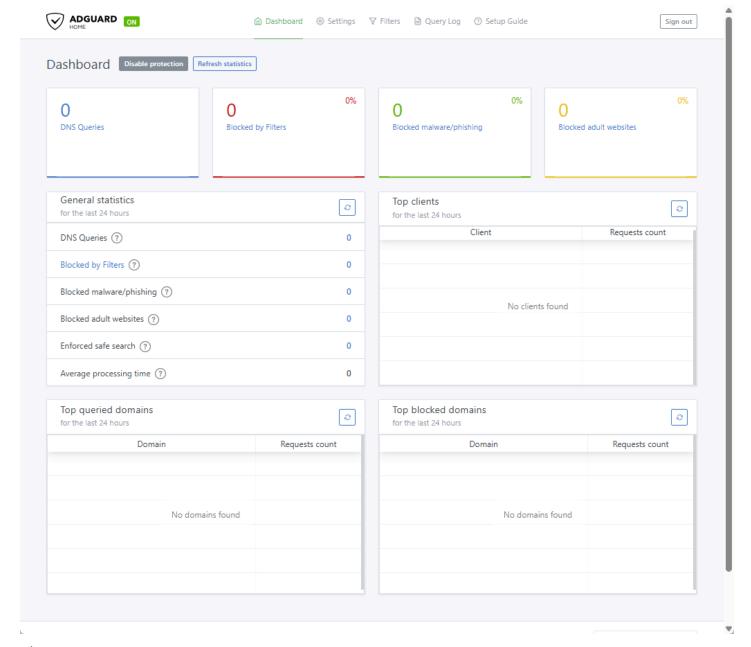

5) Click Open Dashboard.

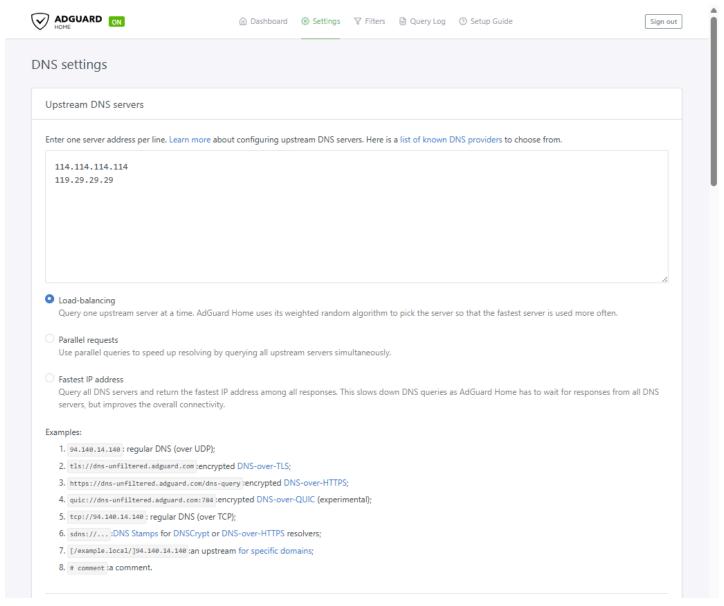

6) Enter your **Username and Password** to log in to the dashboard.

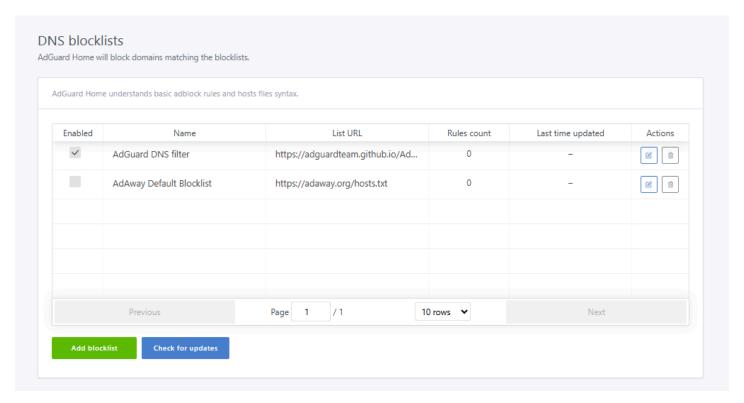

7) In the dashboard, you can monitor the number of DNS blocks and some lists in real time.

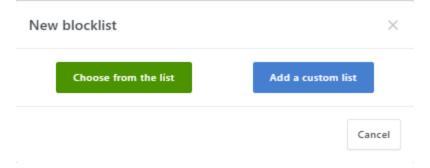

8) If you can not use a default DNS server, you can add a new DNS in **Settings**.

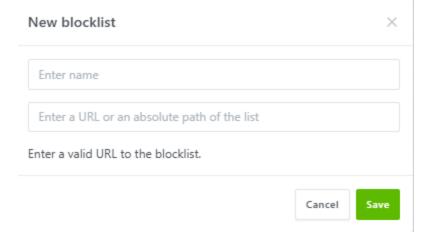

9) If you set DNS blacklists, please access Filter>DNS blocklists.

10) Click New blocklist>Add a custom list.

11) Enter the name and URL of the new blocklist. Click Save.

Chapter 8 NAT Forwarding

This chapter contains the following sections:

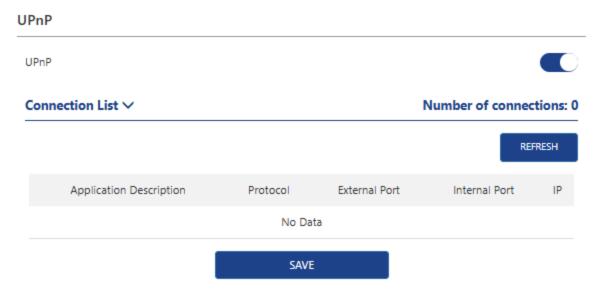

- <u>UPnP Settings</u>
- Port Forwarding
- DMZ
- Hardware NAT

UPnP Settings

UPnP (Universal Plug and Play) is a network protocol designed to make connecting devices simpler and more automated. Using the UPnP protocol, devices can automatically discover each other on the network and establish communication connections without requiring manual configuration or setup.

UPnP allows devices to share resources such as files, printers, and other multimedia content. The UPnP protocol is widely used in home networks and office environments to facilitate communication and interaction between devices.

- 1. Access More>NAT Forwarding>UPnP.
- 2. Set ON/OFF UPnP.
- 3. Click **SAVE** to finish configuration.

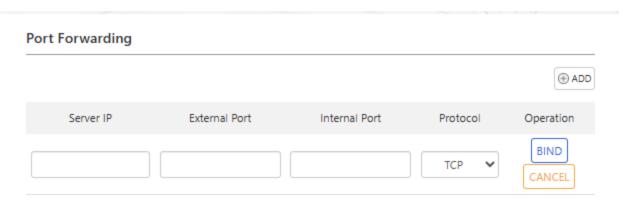

The computer operation system and application program you used need to support the UPnP function.

Port Forwarding

Port forwarding is a network technology. It maps a specific port on a public network to a specified server on the local network, allowing Internet users to access the local network server's service by accessing the port.

- 1. Access More>NAT Forwarding>Port Forwarding.
- 2. Click Add.
- 3. Enter the parameters of **Server IP, External Port**, and **Internal Port**.
- 4. Select Communication Protocol.
- 5. Click **Bind** to finish the configuration.

DMZ

Enable DMZ (Demilitarized Zone) management function, only enter one IP address that connects this device, then this device can be DMZ host. So this device can be accessed via external network and open all ports to improve fluency of corresponding communication. Please note security software and firewall on this host need to be closed temporarily when you use this function. So please consider using this function carefully.

(i) NOTE

DMZ is suitable for use when you are not sure of the ports that need to be opened. Computers will be completely exposed to the WAN after opening DMZ Host, which may bring security risks to computers. So please do not open it easily. Close it in time if you do not need to use DMZ Host.

- 1. Set the computer to a Static IP such as 192.168.20.215.
- 2. Access More>NAT Forwarding>DMZ.
- 3. Open **DMZ Host**.
- 4. Enter the **IP address** of the corresponding computer (192.168.20.215).
- 5. Click **SAVE** to finish the configuration.

Hardware NAT

Data is forwarded by hardware instead of being processed by the CPU after enabling Hardware NAT, which can improve the device's performance. Turn off NAT if you need to calculate throughput rate, usage statistics of CPU and RAM.

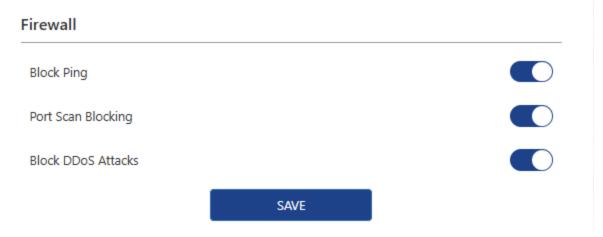

- 1. Access More>NAT Forwarding>Hardware NAT.
- 2. Open Hardware NAT.
- 3. Click **SAVE** to finish the configuration.

Chapter 9 Network Security

This chapter contains the following sections:

- Firewall
- ALG Configuration
- MAC Filter

Firewall

- 1 . Access More>Security>Firewall.
- 2 . Open **Block Ping**: It can prevent ping attacks and scanning and reduce the risk of network attacks on this device.
- 3 . Open **Port Scan Blocking**: It can protect server ports on devices from attacks.
- 4 . Open **Block DDoS Attacks**: It enables the router to avoid the massive resource consumption caused by DDoS attacks and ensures normal services.
- 5 . Click **SAVE** to finish the configuration.

ALG Configuration

ALG (Application Layer Gateway) allows a custom NAT traversal filter to be inserted into the gateway to support the address and port translation of certain application layer "control/data" protocols. Keeping default settings is recommended. When you use voice and video applications to create or receive calls through the router, you may need to disable SIP ALG because some voice and video applications do not work well with SIP ALG.

ALG		
PPTP Passthrough		
L2TP Passthrough		
IPSec Passthrough		
FTP ALG		
TFTP ALG		
RTSP ALG		
H323 ALG		
SIP ALG		
	SAVE	

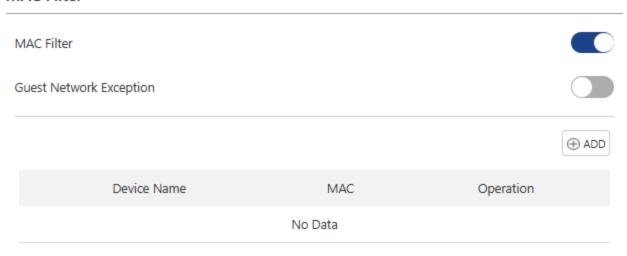

- 1 . Access More>Security>ALG.
- 2 . After configuration, please click **SAVE** to finish.

MAC Filter

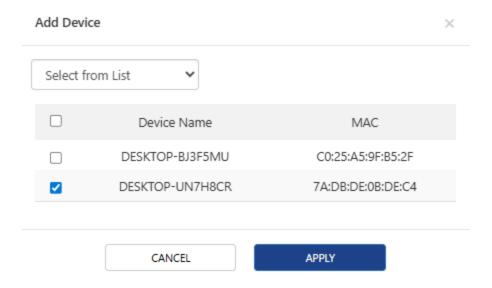

MAC address filtering applies to devices on the wireless/wired network. Devices on the filter list will be unable to access the Internet and will also be blocked from the router's management interface.

Note: This function may not work for terminals that use random MAC addresses.

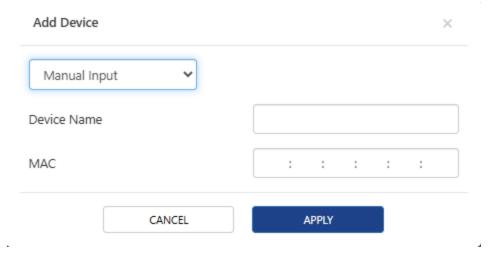

MAC Filter

- 1 . Click **Security > MAC Filter**.
- 2. Click MAC Filter to enable it.
- 3 . If the **Guest Network Exception** is enabled, the devices in the guest Wi-Fi will not be blocked by this function.
- 4. Click ADD to add new rule.
- 4.1 Select corresponding **Device Name** and **MAC address** from the list.

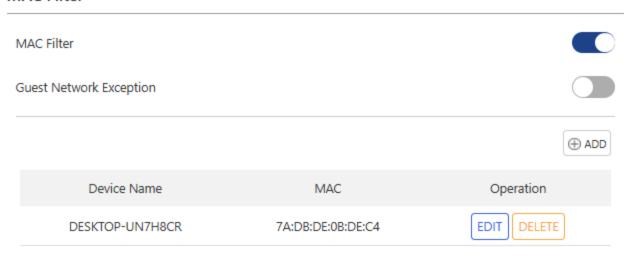

4.2 Or manually input **Device Name** and **MAC address** to add device.

5 . After adding the device, you can edit or delete the devices added.

MAC Filter

Chapter 10 VPN Server and Client

This chapter contains the following sections:

- <u>VPN Server Configuration</u>
- VPN Client Configuration

VPN Server and Client

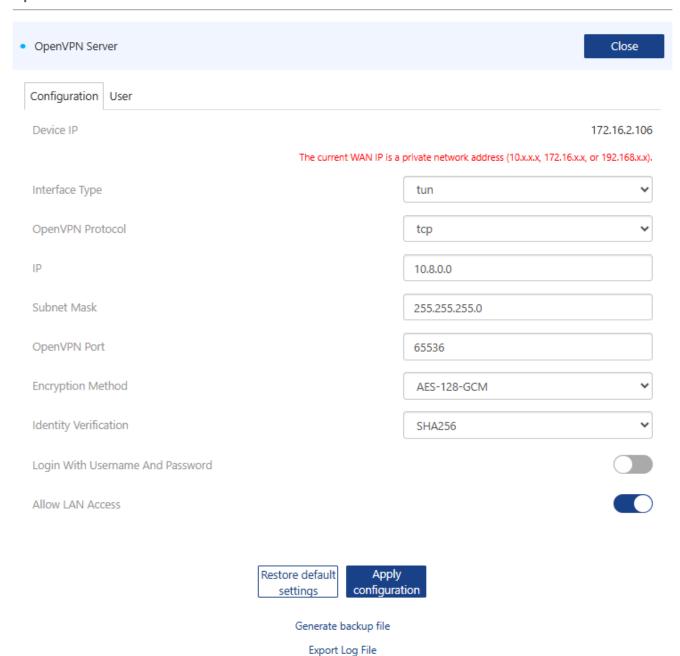

VPN (Virtual Private Network) can encrypt your network connection to ensure the safe transfer of important data and avoid information stealing. Remote users (VPN clients) can safely connect VPN server.

VPN Server Configuration

Open VPN Server Configuration

OpenVPN Server is used for remote devices to establish an OpenVPN connection to access your home network. If you use VPN function, you need to enable the OpenVPN server on a router and then install and run VPN client apps on remote devices.

OpenVPN Server

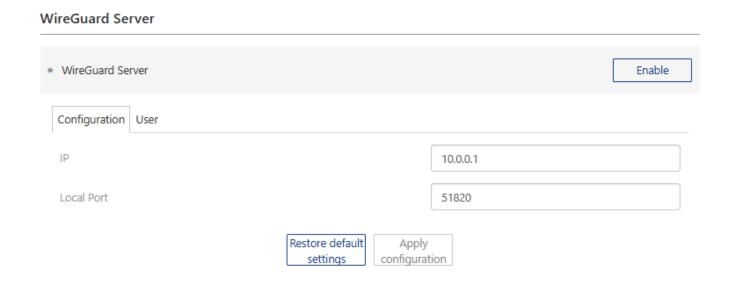

- 1 . Access More>VPN>OpenVPN Server.
- 2 . Open **OpenVPN Server**.
- 3 . Select Interface Type and OpenVPN Protocol.
- 4 . Input the **OpenVPN Port**, which should be from **1024-65535**.
- 5 . In **IP** and **Subnet Mask**, enter the range of IP addresses the OpenVPN server can lease to devices.
- 6 . Select Encryption Method and Identity Verification type.
- 7 . Click **Apply configuration**.

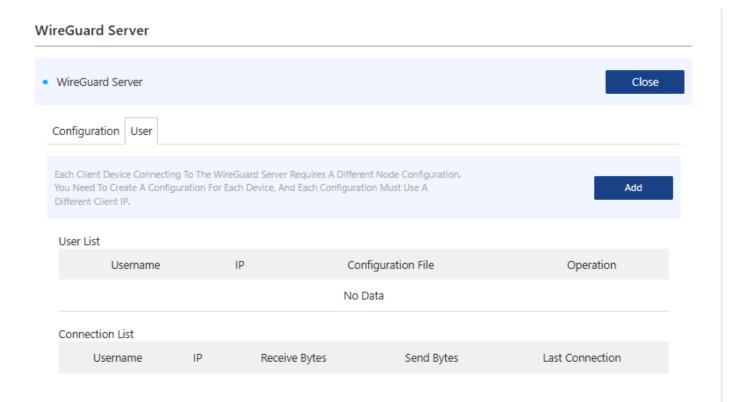

8 . Click **Generate backup file** to save it. VPN client device will establish VPN connection by using the file.

Note: Whenever the OpenVPN server settings are adjusted, the OpenVPN configuration file needs to be re-exported as **step 8**.

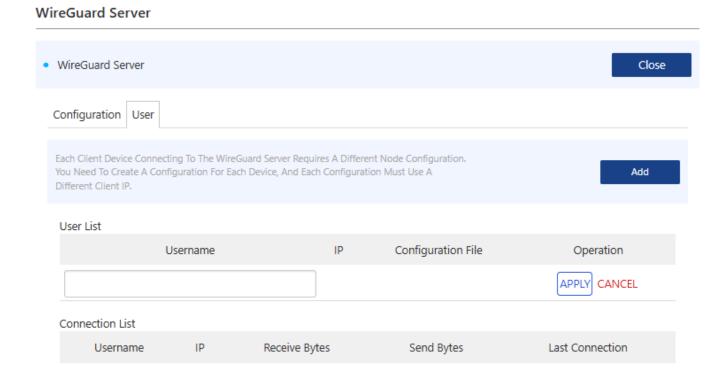

Use WireGuard VPN Server

- 1 . Review the preset WireGuard VPN settings. Do not change them unless necessary.
- 2. Click Enable.
- 3 . **Downloading configuration files:** Each client that needs to connect to the WireGuard Server requires unique node configuration, so creating a configuration in unique client IP for each device as the following steps:

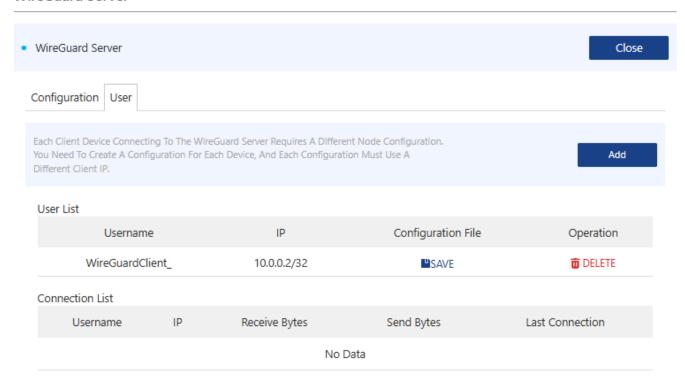

- 3.1 Click User.
- 3.2 Click **Add**, then input **Username** and click **APPLY**.

3.3 After adding successfully, click **SAVE** to obtain a **.conf** configuration file, then import this file into your WireGuard client.

WireGuard Server

VPN Client Configuration

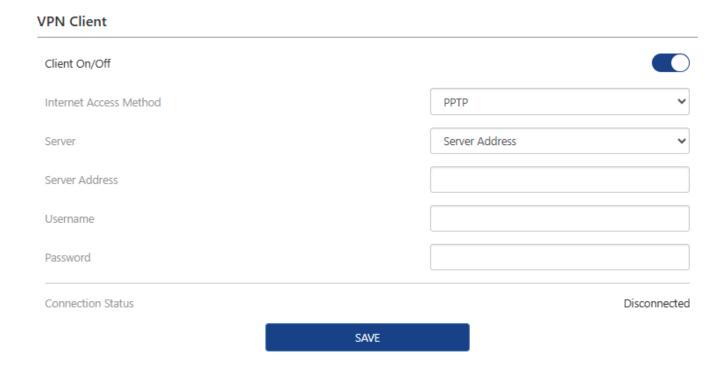

VPN client can establish VPN connection for devices in your home network to access remote a VPN server.

PPTP/L2TP VPN Client Configuration

VPN converts public networks (Internet, etc.) into private networks using encryption technology to offer greater security and privacy protection.

Client On/Off Internet Access Method PPTP Server Server Address Username Password Connection Status Disconnected

- 1 . Access More>VPN>VPN Client.
- 2 . Open **VPN Client**.
- 3 . Select Internet Access Method.
- 4 . Select server domain or server address in **Server**, then enter corresponding parameter in **Server Address**.

 ${\bf 5}$. Click SAVE to finish the configuration.

OpenVPN Client Configuration

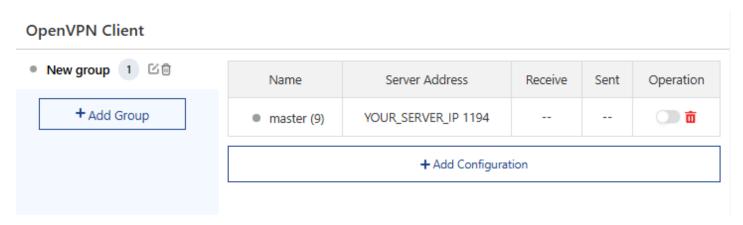

- 1 . Access More>VPN>OpenVPN Client.
- 2 . Click **Add Group** to add new group, then click **Add Configuration** to add new configuration.

OpenVPN Client New group ☑ □ Name Server Address Receive Sent Operation + Add Group + Add Configuration

3 . Click to upload files or drag and drop files into the box.

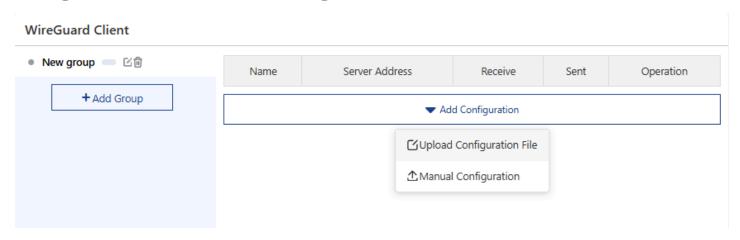

4 . After a successful configuration, click the checkbox below the action bar to enable OpenVPN.

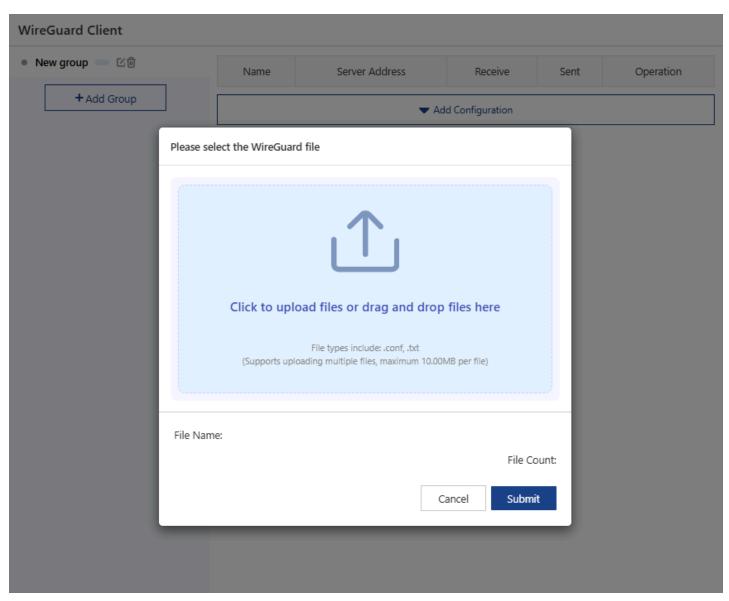

WireGuard VPN Client Configuration

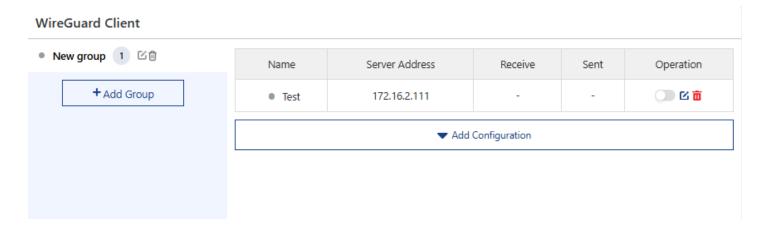

- 1. Access More>VPN>WireGuard VPN Client.
- 2 . Click **Add Group** in New group, then click **Add Configuration**, select **Upload Configuration File** or **Manual Configuration**.

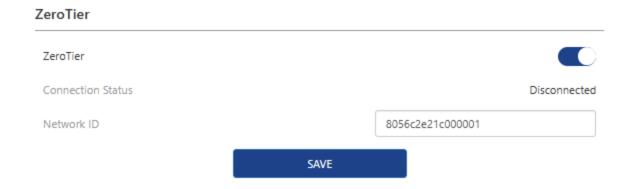

3 . After selecting **Upload Configuration File**, click to upload files or drag and drop files into the box, then click **Submit**.

4 . After a successful configuration, click the checkbox below the action bar to enable WireGuard.

ZeroTier Configuration

- 1. Access More>VPN>ZeroTier.
- 2 . Open **ZeroTier**.
- 3 . Enter **Network ID** obtained on the Zerotier manage page.
- 4 . Click **SAVE** to finish the configuration.

Chapter 11 USB Setting

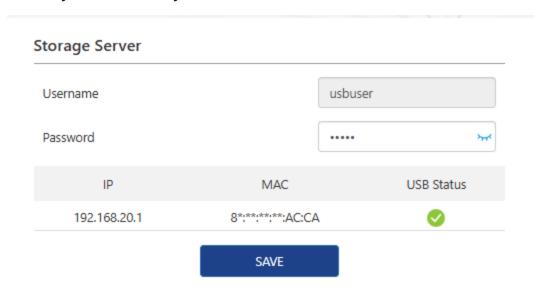

This chapter introduces USB storage service, USB tethering, and print service.

It contains the following sections:

- Storage Server
- **USB Tethering**
- Print Service

Storage Server

Please plug your USB storage device into the router's USB port, then you can access the storaged file locally and remotely.

- 1. Plug the USB storage device into the router's USB port.
- 2. Windows PC: Input the IP address (for example:\192.168.20.1)in the address bar of the file explorer.

MAC PC: Enter Connect to Server, and input IP address(for example:\192.168.20.1).

- (i) NOTE: ONLY EXFAT, FAT32, AND NTFS FILE FORMAT SUPPORTED.
- 3. Use the username and password you set before to access it. If you need to change your password, please click **More>USB>Storage Server**.

USB Tethering

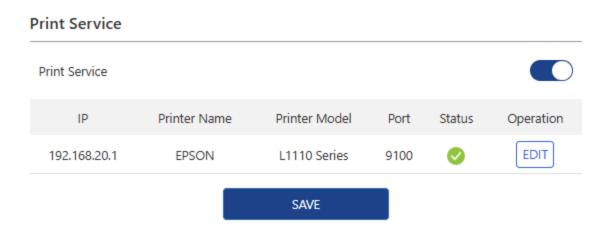

You can connect your phone to this router via the USB port to enable the USB network tethering feature, which allows network communication between other devices and this router.

- 1. Choose More>USB>Storage Server.
- 2. Click to open **USB Tethering**.
- 3. Click on "**SAVE**" to complete setting.

Print Service

USB print service function allows your devices to connect to the USB printer. Within this router's range, multiple devices can access and use the printer simultaneously to print.

- 1. Connect the printer to the USB port of this router, the system can detect the printer automatically.
- 2. Install the printer's driver and software application on your device(such as a laptop or mobile phone).
- 3. Connect your device to this router's wireless network or its LAN port and ensure the device is connected to the router's network.
- 4. Click on More>USB>Print Service.

- 5. Click on **Print Service** to enable it.
- 6. Click on **SAVE** to complete.

Chapter 12 Remote Access

This chapter introduces remote web access and cloud APP.

It contains the following sections:

- Remote Web Access
- Cloud App

Remote Web Access

With this function, you can manage this router remotely via the Internet. Input "http://WAN IP: port number" for remotely accessing this device. We recommend you write this router's WAN port number down before using this function.

- 1. Access to More>Remote Access>Remote Web Access.
- Turn on Remote Web Access.
- 3. Set External Port.
- 4. Click on **SAVE** to complete settings.

Cloud APP

With this function, you can control this router remotely from the cloud with the APP.

Cloud App Connection Status Connected SAVE

Don't have the app? Click to download

- 1. Access to More>Remote Access>Cloud APP.
- 2. Click on **Cloud APP** to enable the function.
- 3. Click on "SAVE" to complete settings.

(i) NOTE:

If you didn't download APP, please click on **Click to download** to scan the pop-up QR code for downloading. You can also scan the QR code directly to obtain APP.

Scan the QR code using your phone to download the app.

Chapter 13 NET Tools

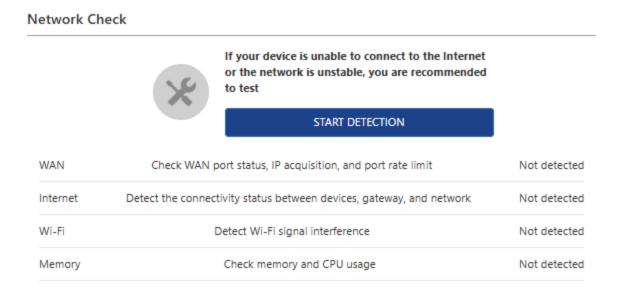

This chapter introduces how to check network status, test network connection, and enable Wake-on-LAN function.

It contains the following sections:

- Network Check
- <u>Diagnostics</u>
- Wake On LAN

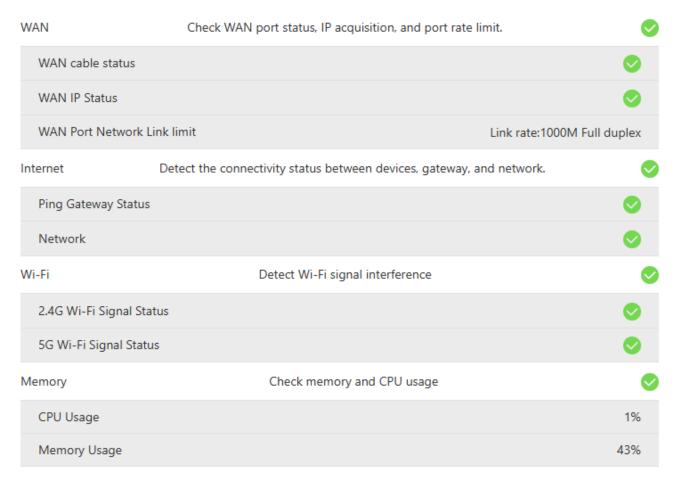

Network Check

You can scan the entire network to analyse and optimize network status via network check.

- 1. Access to More>NET Tools>Network Check.
- 2. Click on **START DETECTION**.

3. Click on "ONE-CLICK REPAIR" or manually optimize your network with prompts.

Diagnostics

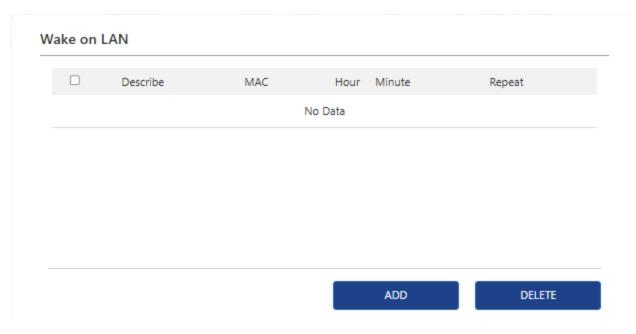

Diagnostics		
Ping Or Route Tracking	Ping	~
IP Address Or Domain Name	www.biying.com	
PING		
PING www.biying.com (202.89.233.100): 56 data bytes 64 bytes from 202.89.233.100: seq=0 ttl=117 time=44.165 ms 64 bytes from 202.89.233.100: seq=1 ttl=117 time=43.364 ms 64 bytes from 202.89.233.100: seq=2 ttl=117 time=43.051 ms 64 bytes from 202.89.233.100: seq=3 ttl=117 time=42.965 ms www.biying.com ping statistics 4 packets transmitted, 4 packets received, 0% packet loss round-trip min/avg/max = 42.965/43.386/44.165 ms		

- 1. Access to More>NET Tools>Diagnostics.
- 2. In the dropdown list **Ping Or Route Tracking**, choose **Ping** or **Traceroute**.
- **Ping**: used for checking the connection between the router and the target device whether normal or not.
- **Traceroute**: used for checking the node information between the router and the target device.
- 3. Input the **IP Address Or Dormain Name** that you want to test.
- 4. Click on **PING** button for testing.

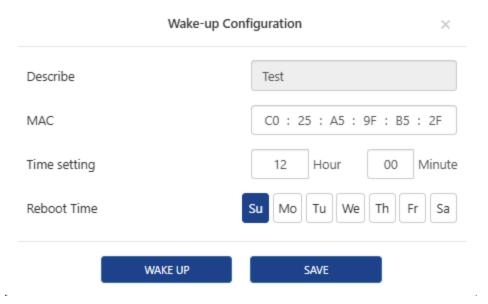

Wake On LAN

Wake-On-LAN (WOL) is a technology where the network interface card (NIC), along with other software and hardware, sends a specific data frame to the NIC that is in standby mode, enabling the computer to start up from a powered-off state.

1. Access to More>NET Tools>Wake On LAN.

2 . Click on Add to start Wake-On-LAN setting.

- ${\bf 3}$. Add the ${\bf Discribe}$ of the configuration.
- 4 . Input the **Mac Address** of the device that you want to remotely wake up.
- ${\bf 5}$. Set Time setting and Reboot Time.
- ${\bf 6}$. Click on SAVE, complete the configuration.

Chapter 14 System Setting

This chapter introduces firmware update, password change, system log, system time setting, indicator setting, backup and restore, and how to restart router.

It contains the following sections:

- Firmware Upgrade
- <u>Change Password</u>
- System Log
- Time Zone
- LED Control
- Backup & Restore
- Scheduled Reboot

Firmware Upgrade

Regular firmware upgrade can obtain the newest functions and security patches, improving the performance and stability of the router, and fixing possible bugs and security risks.

WAVLINK provides two ways to upgrade your firmware: local upgrade and online upgrade. You can choose one of them to update your firmware.

Access to More>System>Firmware Upgrade.

Local Upgrade

Manually upgrade the firmware. You can download a new firmware file from the official WAVLINK website. The following devices are the same model as the devices you currently connect to.

(Mesh Device		Current Version			
(Router		M92AX6AI_V241119)		
		New Firmware	Choose File				
			UPLOAD FILE				
The following devices are different models from the devices you are currently connected to. You can upgrade them by clicking the Upgrade link to access the Manual Upgrade page.							
	Mesh Device		Current Version Upgrade Link		rade Link		
			No Devices				
Online Upgrade							
If the device has Internet access, you can upgrade online. After checking the latest firmware version, click the "ONE-CLICK UPGRADE" button.							
	Mesh Device	MAC	Current Version	Latest Version	Status		
	Router	8*:**:**:AC:CA	M92AX6AI_V241119	No new version available	Not upgradable		
CHECK FOR NEW VERSION ONE-CLICK UPGRADE							

Local Upgrade

- 1. Access to WAVLINK official website: **www.wavlink.com**. Download the corresponding upgraded software of the current hardware version.
- 2. Select the device that needs to be updated.
- 3. Click on **Choose File** or **File** icon, and select the firmware file that needs to be uploaded. Click on **UPLOAD FILE**.
- 4. Wait for the completion of updating.

(i) NOTE:

- After updating, the router will automatically reboot to apply new firmware. The process will take few minutes to complete, please wait patiently.
- During updating, the router can't be powered off in case the router's firmware gets damaged.

Online Upgrade:

- 1. Choose the device that needs to be updated.
- Click on CHECK FOR NEW VERSION to view the upgradable version to update. Or directly use ONE-CLICK UPGRADE.
- 3. Wait for the update completion.

(i) NOTE:

- After updating, the router will automatically reboot to apply new firmware. The process will take few minutes to complete, please wait patiently.
- During updating, the router can't be powered off in case the firmware gets damaged.
- When CHECK FOR NEW VERSION, if the prompts show that the firmware is the newest version, there is no need to upgrade the router.

Change Password

Old Password New Password The password should be at least 6 chara. Confirm New Password The password should be at least 6 chara. SAVE

- 1. Access to More>System>Change Password.
- 2. Input the current one on the **Old Password** text field.
- 3. Input the new one on the **New Passowrd** text field.

- 4. Input the new one on the **Confirm New Password** text field, ensuring the inputed password is the same as the new password.
- 5. Click on **SAVE** to complete password changing.

System Log

When it comes to malfunction, reserve the system log and send it to technical support for trouble shooting.

System log

System Log Export log

```

- 1. Access to **More>System>System Log**.
- 2. Click on **Export log** to save the log to the computer.

Time Zone

The system time is the time displayed when the router is running. The system time you set here is used for other time-based features, like Parental Control.

- 1. Access to More>System>Time Zone.
- 2. Choose the right time zone in the dropdwon list of **Time Zone**.
- 3. Turn on/off **Daylight Saving Time(DST)**.
- 4. Click on **SAVE** to complete the configuration.

Led Control

The router's indicators are used for indicating the device's status or running. By setting the indicator, you can know the device's working status more clearly, find and ban machine problems in time.

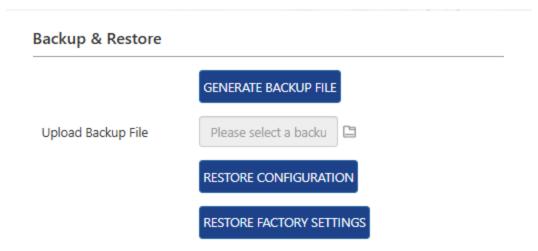

- 1. Access to More>System>Led Control.
- 2. Turn on/off LED Status.
- 3. Click on **SAVE** to complete the configuration.

Backup & Restore

Please configure settings as a configuration file stored in the router. You can backup this configuration file into your computer for future use, and restore the router to the previous setting with this backup file. Furthermore, if necessary, you can delete the current system setting and reset the router to the default factory settings.

Access to More>System>Backup & Restore.

Backup the current configuration of the router

Click on **GENERATE BACKUP FILE** to store the copy of current setting on the local computer, and name the file **backupsettings**.

Restore the router's configuration:

- 1. Click on **UPLOAD**, and choose the backup configuration file that was stored on the computer.
- 2. Click on **RESTORE CONFIGURATION**, and wait a few minutes to restore the configuration and restart the router.

Reset the router to the default factory settings

- 1. Click on **RESTORE FACTORY SETTINGS** to reset the router.
- 2. Wait a few minutes for the reset and reboot.

Scheduled Reboot

When your router has a network malfunction, you can try to use the reboot function to solve the problem. Sometimes, the router may experience software errors or memory overflow issues, leading to network instability. Under these circumstances, you can reboot the router to solve this problem and get the network back up.

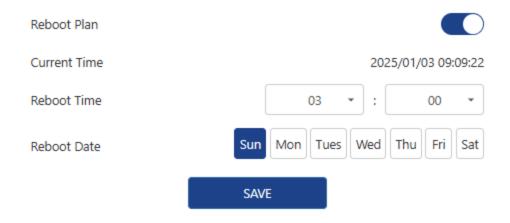

After modifying some settings of this router, you need to reboot the router to make the settings valid. Using the reboot function can quickly update the router's settings and make it valid.

- 1. Access to More>System>Scheduled Reboot.
- 2. Click on ROUTER REBOOT.

3. After clicking, a window will pop up, in which you will be asked whether to restart the router or not. If you want to reboot the router, choose **OK**. If not, choose **Cancel**.

Set Scheduled Reboot Plan

The automatic reboot function can clear unnecessary data in the router and automatically choose the best wireless channel.

Before turning on Reboot Plan, please ensure the system time is right. If the router's designated reboot time is less than 60 minutes, some unnecessary reboots won't be executed.

1.Access to More>System>Scheduled Reboot.

- 2.Turn on **Reboot Plan**.
- 3.Choose the router's **Reboot Time**, and the **Reboot Date** to decide on reboot frequency.
- 4.Click on **SAVE** to complete the configuration.

Chapter 15 Logout

Logout

If you need to log out, please access to **More** on the management page, then click on **Logout**.

Chapter 16 FAQ

- FAQ
- Aftersale Service

FAQ

Q1. Why doesn't the login page appear after entering http://wavlogin.link?

- Make sure you connected the WiFi signal of WAVLINK device.
- Please make sure you entered the correct URL.
- If log in by phone and the log-in page doesn't appear, turn off your mobile network and try again.

Q2.What should I do if I can't access the Internet from the WAVLINK device?

- 1.Restart your modem (wait 5 minutes). Disconnect extra Ethernet cable connection from the modem.
- 2.Test by connecting a computer directly to the modem. If issues persist, contact your ISP.
- 3. Check the router's web management page:
 - Verify Internet icon status on the home page.
 - If it is blue, set DNS1 to 8.8.8.8 and DNS2 to 8.8.4.4 under More > Network > Internet > Custom DNS.
 - If it is gray, check hardware or contact ISP.
- 4.For cable modems, clone the MAC address of the device which could get Internet from the modem via Ethernet cable in More > Network > Internet > MAC Clone > Custom MAC, then reboot modem and router.

Q3. How do I restore the device to factory default setting?

Press and hold the reset button of the device for 6 seconds.

Q4.What can I do if I forget my administration management password?

Please reset the device, the default password is admin.

Q5. How do I find the best location for my device?

Please put your device in a relatively open space to avoid obstacles such as metal objects, reinforced concrete walls and so on.

Q6.Why the flow monitoring is inaccurate?

 The Hardware NAT Settings' default open status leads to the absence of monitored data. If you wanna keep the flow monitoring accurate, you have to turn off the Hardware NAT Settings function manually, which inevitably will increase the CPU usage.

Chapter 17 Safety and Emission Statement

CE Mark Warning

This is a Class B product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

NOTE:

- (1)The manufacturer is not responsible for any radio or TV interference caused by unaut horized modifications to this equipment.
- (2)To avoid unnecessary radiation interference, it is recommended to use a shielded RJ4 5 cable.

Declaration of Conformity

Hereby, Winstars Technology Limited, declares that the radio equipment type MIGHTY LX2 is in compliance with Directive 2014/53/EU.

The full text of the EU declaration of conformity is available at the following Internet add ress:https://www.wavlink.com/en_us/ce.html

FCC Statement

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment dose cause harmful interference to radio or television reception, which can be determined by tuming the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.

- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

FCC Caution: Any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

The manufacturer is not responsible for any radio or TV interference caused by unauthorized modifications to this equipment.

Radiation Exposure Statement

This device complies with FCC radiation exposure limits set forth for an uncontrolled environment and it also complies with Part 15 of the FCC RF Rules.

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

NOTE:

- (1) The manufacturer is not responsible for any radio or TV interference caused by unauthorized modifications to this equipment.
- (2) To avoid unnecessary radiation interference, it is recommended to use a shielded RJ45 cable.
